KOVANOV, V.V. Prof. Burdenko's Dept of Surgery, University of Moscow
The permeability of the hemato-encephalic barrier to penicillin under normal and pathological conditions.
Khirurgiya 1947, 1 (12-18)

Burdenko has developed a method for intra arterial injection into the carotid arteries of sulfonamides, for the treatment of intra cerebral infections following injuries to the head. Experiments by Paramonov demonstrated that the introduction of a ten percent solution of sulphidine (0.3 Gm per kg body-weight) into the carotid artery results in a concentration of 28 mgm per cent of the sulphidine in the blood of the brain vessels and a concentration of 20 mgm per cent in the cerebrospinal fluid. When the drug is given intravenously, the concentration in the blood is only 5 mgm per cent and in the CSF 2 mgm percent. Burdenko gave penicillin by this route to patients suffering from meningitis, meningo-encephalitis, cerebral abscesses, etc. following cerebral injuries. The penicillin was given in doses of 10,000U into the carotid artery each day, 4000U being given intramuscularly at the same time. Kornianovsky, in 16 patients treated in this way, had only two deaths. The others recovered completely and permanently. Yegorov in Moscow was able, by the introduction of the intracarotid method, to lower the percentage of deaths from infected cranial injuries from 37.5% to 12.4%.

In order to ascertain the dose of penicillin that was optimal for this purpose, experiments were carried out on dogs. Eight dogs were given doses of penicillin varying from 10,000 to 100,000U. It was found that with intra-arterial doses ranging from 10,000 to 30,000U the penicillin concentration in the CSF was only 0.2 to 0.4 U, while at the same time the concentration in the venous blood was 6 to 12 U. With doses of 60,000 to 100,000 U the CSF concentrations of penicillin rose to 1.6 - 3 U. Thus, the hemoencephalic barrier of these normal dogs was impassable for much of the penicillin. The blood

Moscow Order of Lenin Med. Inst. * Mechanical and hand suture of
blood vessels BRIT. MED. J. 1956, 4074 (1003-1005)
Technical achievements and methods of blood vessel anastomosis are reviewed.
In addition, a new method of end-to-end blood vessel anastomosis is presented.
This comprises the use of a mechanical apparatus by which the anastomosis is
accomplished by means of fine tantalum clips. Removable bushes from 1.3 to 15
mm., to suit various sizes of vessels, are utilized. The advantages are rapidity,
better inoculation of the vessel ends and placement of the suture material outside
the lumen. The method has proved satisfactory in extensive animal experiments.
It has been used in 23 operations for aneurysm with 18 good and 5 satisfactory

2728

CONT.

results. Apparatus also exists for end-to-side and lateral anastomosis. A new method of manually suturing blood vessels is also described. It is a modification of the circular invaginating suture,

Large Arteries.

Orig Pub: Khirurgiya, 1957; No 10, 63-71.

Abstract: By methods of artericorenography and stereor-
oentgenography with subsequent micro-dissec-
tion, the collaterals in the systems of epig-
astric popliteal, carotid and subclavian art-
eries were studied in human corpses, by expos-
ing the connections between the systems of the
separate vessels and the interior of these sys-
tems. The degree of the participation of the

Abstract: main trunks and their larger branches in the compensatory processes was studied by means of a divided ligature of the vessels at different levels, with subsequent introduction of masses injected above the place where the ligature had been put. In all of the arterial systems studied there were well-developed collaterals, anatomically sufficient for compensation of the impairment of blood circulation. The greatest number of collaterals appeared in the muscles, in the subcutaneous cellular tissue and in the mass of the organs; anastomoses located around the vessel and nerves, inside the skin and in the dense connective tissue are of lesser consequence. Comparison of the anatomical data with

TITLE: New photomaterial of the NIKFI for spectrum analyses in the
short-wave region of ultraviolet radiation

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya, v. 26,
no. 7, 1962, 967-968

TEXT: This report given at the XIV Soveshchaniye po spektroskopii
(XIV Conference on Spectroscopy) deals with new films for vacuum ultra-
violet radiation. The РМ-1Л (RM-1L) film with highly sensitive emulsion
sensitized with luminophores had been developed by the NIKFI
(A. O. Kondakhchan) and the Shostkinskiy khimicheskiy zavod (Shostka
Chemical Plant). The УФ-НИКФИ (UF-NIKFI) film little sensitive to
visible light, with an emulsion consisting of highly concentrated silver
halide and small amounts of gelatin, was produced by a method (thin-layer
separation) developed by K. S. Bogomolov, M. Yu. Deberdeyev, A.A.Sirotinskiy
and members of the NIIKhIMMASH. The new films, especially UF-NIKFI

TITLE: NIKFI photographic materials for the vacuum ultraviolet region of the spectrum and their characteristics

SOURCE: Zhurnal nauchnoy i prikladnoy fotografii i kinematografii, v. 9, no. 4, 1964, 286-288

TOPIC TAGS: ultraviolet photographic film, film characteristic, film sensitivity, silver halide, / ISP 22 spectrograph, DFS 6 vacuum spectrograph

ABSTRACT: The solution of many problems has been hampered by the lack of photographic film sensitive to the vacuum ultraviolet (UF) spectrum ($\lambda < 2200 \text{ \AA}$) as a consequence of strong absorption in the gelatin of the emulsion layer of existing film. NIKFI developed five types of films sensitive to the far UF and soft x-ray region by using a new method of preparing photographic emulsion with a high concentration of silver halide in which a large portion of the gelatin is replaced by surface active substances. The five films differed in size of the AgHal micro-crystals and had different sensitivities. The air-dried emulsion layer $\sim 10 \mu$.

Cord | 1/4

ACCESSION NR: AP4043038

thick was coated on a triacetate base and hardened so that water at temperatures up to 100°C did not melt it. The photographic properties of the film (see Table 1 on the Enclosure) were measured in the visible, near UF region ($\lambda \sim 2300 \text{ \AA}$) and vacuum UF region ($2000 \text{ \AA} > \lambda > 200 \text{ \AA}$). The films UF-2 and UF-3 were developed for 8 minutes in developer D-19 at 20°C and the other film developed similarly for 4-6 minutes. The standard method of sensitometric measurements was used for the visible region; for $\lambda = 2300 \text{ \AA}$ a mercury lamp in a ISP-22 spectrograph with a nine-stage attenuator was used. Characteristic curves (D versus log It) were obtained for all films at $\lambda = 2300 \text{ \AA}$. Films UF-1, UF-2 and UF-3 have low visible sensitivity ideal for "hot" object work. The vacuum UF region was studied using a DFS-6 vacuum spectrograph with a low voltage vacuum spark between titanium electrodes as a light source. The relative spectral sensitivities of films UF-1, UF-2, and UF-3 were obtained at points over the range 200-3000 \AA and the contrast factor for these films for $\lambda = 200-800 \text{ \AA}$ ranged from 0.7 to 1.0, while the other films had a smaller contrast. The storage properties were good and were maximized by storage in a polyethylene pack at 5-7°C (e.g., UF-1 stored two years lost 40% of its sensitivity at $\lambda = 2300 \text{ \AA}$, had no hazing, and preserved its contrast). The preservation of the film was attributed to the high colloidal stability.

TITLE: Investigation of the manufacturing processes of sintered materials for electric contacts

PERIODICAL: Poroshkovaya metallurgiya, no. 3, 1962, 99-109

TEXT: Production of electric contacts having a high wear resistance is described using various metal powders, together with their hardness, density, microstructure and resistance to electric erosion. The best densities and wear resistance under operating conditions were those of tungsten-silver compositions. The authors urge the production of contacts for normal operating conditions on a pilot plant scale. The method of sintering employing high frequency electric current heating is a good means for the production of contacts from pure tungsten. The results obtained are good. It is recommended that the electric erosion of contacts should be tested, to compare the quality of materials produced in Rumania with imported materials, and to indicate the optimum properties. There are 6 figures and 4 tables.

Kovancov, N. I. A triorthogonal system of curves of a complex of straight lines. Doklady Akad. Nauk SSSR (N.S.) 90, 125-128 (1953). (Russian)

In this brief note the author proves that a general line complex in three-space consists of tangents to a two-parameter family of curves. If A is the center of a ray I_3 and I_1 and I_2 are the (unit) principal normal and binormal then $dA = \omega_1 I_1$, from which one obtains the three mutually orthogonal lines $\omega_1 = \omega_2 = 0; \omega_2 = \omega_3 = 0; \omega_3 = \omega_1 = 0$, which are mentioned in the title. M. S. Knebelman.

Title : Spatial indicatrix of geodetic twists of three-orthogonal systems of non-holonomic surfaces

Periodical : Dok. AN SSSR 97/5, 773 - 776, August 11, 1954

Abstract : A method is described for constructing indicatrices of geodetic torsions of non-holonomic surfaces, the tangent planes of which are rigidly coupled to a movable bench mark. The faces of the latter are planes tangent to a system of non-holonomic surfaces, and known as a three-orthogonal system of non-holonomic surfaces. Five references (1846-1948).

Korovin, N. I. Pairs of complexes of a projective rotation. "Dokl. Akad. Nauk SSSR (N.S.)" 100, 863-866 (1955) (Russian). b1 1 - F/W

The equations of the principal surfaces of a ruled complex are almost identical with the characteristic equation of quadric surfaces. A general complex has a characteristic equation with three different roots so that there exist three principal surfaces. The case of three equal roots corresponds to a linear complex so that all its ruled surfaces are principal. This paper is primarily concerned with the case in which the roots $S_1 = S_2 \neq S_3$ are the characteristic roots.

The paper is primarily concerned with the case in which the surfaces are principal, roots $S_1 = S_2 = S_3$ are the characteristic roots. It is this complex that the author calls a complex of projective rotation and shows that each principal surface, in this case, belongs to a pencil of linear complexes.

PG - 950

The present paper joins the earlier investigations of the author (Mat.Sbornik, n.Ser. 38, 107-128 (1956) and Doklady Akad.Nauk 95, 917-920 (1954)). In every plane there lies a one-parametric manifold of complex rays, which in the planes envelop a certain curve s . Taking a two-parametric manifold of planes which e.g. touch a certain surface σ , then the complex can be denoted as the totality of the tangents at the congruence of the curves s which lie in the planes. The author considers those complexes (quasi-special complexes) which admit at least one surface σ which has the following property: for it every curve s degenerates in a point (M). Consequently, the totality of the rays in the tangent plane of σ degenerates to a bundle the center of which lies in M . To the considered class there belong e.g. all complexes with multiple centers of inflection which were considered in earlier papers of the author.

It is shown that if the cone of the complex which corresponds to a point M , degenerates to a plane bundle, then this point is the center of inflection

TITLE: One-parameter families of congruences with linearised focal surfaces. (Odnoparametricheskiye semeystva kongruentsiy s lineychatymi fokalnymi poverkhnostyami)

PERIODICAL: "Matematicheskiy Sbornik" (Mathematical Symposium), 1957, Vol.42 (84), No.1, pp. 45-64 (U.S.S.R.)

ABSTRACT: Complexes are considered, each of which is stratified into a one-parameter family of congruences with linearised focal surfaces. Such complexes are a natural generalisation of the complexes K_2 considered in (1) which were defined as complexes separating into one-parameter families of linear congruences. The generalising characteristic of linearised manifolds becomes obvious since each directrix of the linearised congruences is represented as a strongly degenerate linearised surface. Two one-parameter families of focal surfaces of the congruences under consideration form a certain pair of congruences (S and ζ) and then the complex C , which is the main object of study can be considered as defined by two arbitrary congruences with an arbitrarily-established correspondence between the linearised surfaces which, in some manner, stratify the congruences. In this case, a series of

TITLE The Line-Geometrical Analogy of a Triorthogonal Surface System.
(Lineychnato-geometricheskiy analog triortogonal'noy sistemy po-
verkhnostey - Russian)
PERIODICAL Doklady Akademii Nauk SSSR 1957, Vol 113, Nr 3, pp 497-500
(USSR)
ABSTRACT Received: 6/1957 Reviewed: 7/1957
In further development of the ideas by S.LIE and F.KLEIN, the present paper sets up a certain (by no means complete) parallel between the triorthogonal surface systems of the threedimensional point space and some particular complexes of the straight lines of the fourdimensional line space. The author obtains this parallel by the solution of the following part problem, which, however, is interesting in itself: What properties does a singly taken complex which is decomposed into ∞^1 congruences, possess? The focussing points of these congruences are here assumed to be identical with the point of contact of any main surface of this complex. By canonization of the tetrahedron in a definite manner a system of equations is obtained which characterizes the motion of this tetrahedron. These equations and also the differential equations of the main surfaces are written down explicitly. Also the deter-

CARD 1/2

The Line-Geometrical Analogy of a Triorthogonal Surface System. PA - 3124

mination of the geometric position of the tetrahedron is discussed. Several theorems are given in this paper.

Three two-parametrical families of main surfaces of a complex are dealt with here, which is divided into three one-parametric families of the congruences W. The author here obtains a definite parallelity between the complex investigates and the triorthogonal system of the surfaces of the threedimensional space. This parallelity may be described sufficiently by means of a "dictionary" given here. With the help of this "dictionary" the line-geometrical analogy for certain special classes of the triorthogonal surface systems may be easily determined.

The following special cases are dealt with:

- 1.) The triorthogonal surface systems in the case of which a LAME family is orthogonal with respect to a congruence of straight lines or surroundings.
- 2.) The triorthogonal surface system in which a LAME family consists of spheres or surfaces.

ABSTRACT: The author's numerous publications of the last years concerning all kinds of complexes and related questions are enlarged by a further paper. The author defines a vector field by the determination that as field vector in the point P a vector is to be taken which lies on one of the rays of the complex through P. In this way a set of vector fields is associated to a complex which depends on a function of three arguments. The author considers the question for the possible fibering of the vector fields of this set and the relations between the differential geometric properties (in the sense of the non-holonomous geometry) of the single vector fields. 9 Soviet and 1 foreign references are quoted.
